### ABSTRACT

Given the product value of two non-zero distinct integers  $x$ ,  $y$  and the value of the ratio  $\frac{\text{Arithmetic mean of gcd and lcm of } x, y}{\text{Harmonic mean of gcd and lcm of } x, y}$ , a process of obtaining the values of  $x$  and  $y$  is illustrated.

**Keywords:** Arithmetic mean, Harmonic Mean

**MSC classification number:** 11D99

### INTRODUCTION

Every mathematics student is familiar with the concept of Arithmetic mean, Geometric mean and Harmonic mean between any two Natural numbers. For a variety of problems on Arithmetic mean, Geometric mean and Harmonic mean, one may refer (Bernald and Child, 2006; Hall and Knight, 1998). In page 91 of the journal “The Mathematics Teacher” published by the association of the Mathematics teacher of India, there is a problem involving Arithmetic mean and Harmonic mean. In this short communication an attempt has been made to generalize the above problem.

### MATERIALS AND METHOD

#### *Method of Analysis*

Let  $x$ ,  $y$  be any two non-zero distinct positive integers whose product is denoted by  $P$ .

Let  $p = \text{gcd}(x, y)$ ,  $q = \text{lcm}(x, y)$ . Note that  $q > p$  and  $xy = pq = P$ . Let  $A$  be an arithmetic mean of  $p, q$  and  $H$  be a

Harmonic mean of  $p, q$ . Denote the value of the ratio  $\frac{A}{H}$  by  $N_1$ , a rational number.

Given the values of  $P$  and  $N_1$ , we illustrate below a process of obtaining the values of  $x$  and  $y$ . Consider

$$\frac{A}{H} = N_1 \Rightarrow (q + p)^2 = 4PN_1$$

$$q + p = 2\sqrt{PN_1} \tag{1}$$

We have the identity

$$(q - p)^2 = (q + p)^2 - 4pq$$

$$\Rightarrow (q - p)^2 = 4PN_1 - 4P$$

$$(q - p) = 2\sqrt{P(N_1 - 1)} \tag{2}$$

Solving (1) and (2), we get

$$q = \sqrt{PN_1} + \sqrt{P(N_1 - 1)}$$

$$p = \sqrt{PN_1} - \sqrt{P(N_1 - 1)}$$

It is note worthy that the products  $PN_1$  and  $P(N_1 - 1)$  should be perfect squares. Since  $p$  is the gcd ( $x, y$ ), we write

$$x = pX, y = pY, \text{ where } \text{gcd}(X, Y) = 1 \tag{3}$$

Now,  $P = xy = p^2 XY$

## Research Article

$$XY = \frac{P}{p^2} \quad (4)$$

Which should be an integer. Then, it is possible to choose X,Y such that  $\gcd(X,Y)=1$ . Substituting the values of p, X, Y in (3), the values of x, y are obtained.

A few examples are given below.

S.no	P	$N_1$	$PN_1$	$P(N_1 - 1)$	p	XY	X	Y	x	y
1	192	$\frac{169}{48}$	676	484	4	12	4 12	3 1	16 48	12 4
2	192	$\frac{4}{3}$	256	64	8	3	3	1	24	8
3	60	$\frac{64}{15}$	256	196	2	15	5	3	10	6
4	36	$\frac{25}{9}$	100	64	2	9	9	1	18	2
5	24	$\frac{98}{48}$	49	25	2	6	3	2	6	4
6	256	$\frac{100}{64}$	400	144	8	4	1	4	8	32
7	100	$\frac{169}{25}$	676	576	2	25	1	25	2	50

## CONCLUSION

To sum up, the following three conditions have to be satisfied

- 1)  $PN_1$  is a perfect square
- 2)  $P(N_1 - 1)$  is also a perfect square
- 3)  $P \equiv 0 \pmod{p^2}$

Also from the above table, it is observed that when P is a perfect square the ratio  $\frac{(\text{Geometric mean of } p,q)^2}{\text{Harmonic mean of } p,q}$  is an integer representing hypotenuse of a Pythagorean triangle.
